

ABSTRACT

When entrance administration equipment detects an approaching user, it transmits a communication trigger command to a portable telephone, carried by the approaching user. When it receives a response signal from the portable telephone, it transmits a transmitting command of embarkation person information. When it receives the person's embarkation information from the portable telephone, it executes an authentication process. When the person's embarkation information does not coincide with data of the embarkation-scheduled person database, the entrance administration equipment displays a message of a failure of the authentication process. When the authentication process succeeds, the entrance administration equipment records the person's embarkation information, opens the door, issues a printed ticket containing the person's embarkation information, and transmits a control signal for turning off power of the portable telephone to the portable telephone.
